

Questions and Answers

Q: What is Low Level Laser Therapy?

A: LLLT is a technology employed to combat thinning hair and scalp disorders, by focusing laser energy to target areas stimulating the body's natural ability to repair itself.

Q: Is LLLT FDA approved?

A: Yes, and benefits have been scientifically measured. The effects were evaluated utilizing a double blind test.

-All patients with the exception of one showed complete stop of hair loss.

-All patients, except three, showed clear re-growth of hair with a reduction of at least one Hamilton Classification.

-Out of 18 patients, 14 showed an increase in thickness and all 18 showed improvement in general hair shaft quality. The results showed no improvement in the placebo group or any adverse effect of treatment.

Q: What type of results can I expect?

A: Hair count in men and women increased 93.5% on average and hair tensile (strength) increased 78.9%.

Q: Can I use it with transplants?

A: Yes, It has proven to be very helpful when used before and after transplant procedures to establish new grafts and minimize shedding.

Q: Is LLLT painful?

A: No, It is a comfortable pain free process, that may clients describe as a quiet moment to themselves.

Q: Is there any down time?

A: No, you may return to your normal activities immediately.

NEW LIFE ANTI-AGING

Laser Hair Restoration

LOOK GOOD FEEL GOOD

Benefits of laser treatment programs:

- Stimulates hair follicle and increases blood flow
- Stops hair loss and helps to re-grow hair
- Unlike many treatments, laser works on all areas of the scalp
- Fuller, shinier, softer, thicker, and more manageable hair
- Repairs and improves hair shaft quality
- Relieves irritating scalp conditions
- Increased hair strength and elasticity
- Enhances the lasting effects of hair colors and perms by closing the cuticle
- Better curl retention
- Longer lasting color, less fading, and oxidation
- Bonds and locks conditioners for enhanced results
- Repairs damage normally caused by chemical services

How does laser therapy work?

Laser light uses the scientific principle of photo biotherapy. This process occurs when cells absorb light and repair themselves. Laser light penetrates deep into the tissues of the scalp, stimulating micro-circulation of blood supply, cell metabolism and protein synthesizes. Clinical studies suggest that this cellular and sub-cellular activity breaks down the collection of DHT helping to stop hair loss.

Studies suggest laser works by three mechanisms:

Energization - Laser light increases the energy available to cells so they take in nutrients faster and get rid of waste products. For this reason low level laser has been used for the past 30 years in applications such as wound healing.

Circulation - Studies show that laser increases circulation and oxygenation of the blood to the scalp and hair bulb. Laser also removes calcification and blockages around the hair bulb; as well as increases cell replacement or regenerative activity. Laser helps hair to improve in fullness, shine, body, and elasticity; therefore problems such as excessive oily or dry scalp, dandruff and itchiness can also be reduced.

Vibration - The soft tissue and fluids in our bodies vibrate. They do this within a frequency range similar to that of cold-beam, red-light laser. When its vibrations become irregular or out-of-step, it can be brought back into "synchronization" by being irradiated with low level laser.

Utilizing a complete program makes sense:

Utilizing a complete program, including laser and topical products allows you to maximize your results, because the products work synergistically. Each product works differently to stop hair loss and improve your chance of greater hair growth.

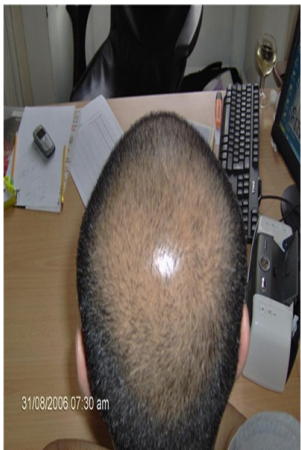

Step 1: Make nutritional changes if necessary

Step 2: Use topical activators to promote re-growth and balance hormones.

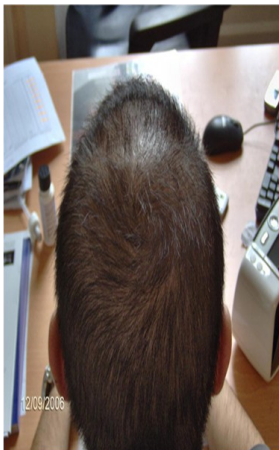

Step 3: Utilize in-clinic laser to jump start re-growth

New Life Anti-Aging Clinic hair re-growth program is a multi-modal approach that combines anti-androgens, hormone balancing, auto immune protective agents, oxygen free-radical inhibitors, hair growth stimulators and new FDA cleared laser treatment to stop hair loss and generate new hair growth.
